

## tesa IdentSeal® – permanent identification, sealing and warranty protection

### tesa IdentSeal®

The tesa IdentSeal® technology offers you a broad spectrum of intelligent product identification options – including design flexibility, efficient inscription and cutting processes, as well as overt and covert security features.

The result: clear and individualised product identification, protecting your brands against counterfeiting or manipulation and serving as [warranty protection](#) even after years.

tesa IdentSeal® is well suited for robust nameplates, product identification labels, demanding sealing applications, e.g. of product packages, or numerous other applications.

### tesa IdentSeal® - Fortified identification labels

Fortified identification labels

tesa IdentSeal® wards off any manipulation with partial destruction and is thus protected against reuse or unauthorised access. Comparable to sealing wax, the brittle security substrate flakes off at an attempt to remove the label or to open a sealed package. Any access is immediately obvious.

### **tesa IdentSeal® - Efficient laser production**

#### Efficient laser production

tesa IdentSeal® labels are written and cut virtually waste-free with a computer-based laser inscription process. That means: flexible label adjustments even to complex product geometries without any problem, effective material yield and easy assignment of individual product information, such as serial numbers or barcodes.

### **tesa IdentSeal® - Versatile material substrates**

#### Versatile material substrates

Together with distinctive product identification, the tesa IdentSeal® material substrates provide options to integrate optical and haptic security and information features. From tactile markings to a proof of removal visible under UV light.
